

SEM fleet executive center

A leadership view of portfolio health, mix, risks, and actions

PORTFOLIO DEMONSTRATION - ILLUSTRATIVE DATA

QUESTION

What does leadership need to see to judge fleet health and direct the next review?

DECISION

Use a four-layer reading path: status, trend, composition, and campaign accountability.

EVIDENCE RETAINED

Dashboard architecture, trend interpretation, campaign concentration, and the scaling roadmap.

VALIDATION

Reconcile source totals, define every KPI, annotate incidents, and review outliers before action.

1 KPI Layer

2 Performance Trend

3 Device Intelligence

4 Campaign Matrix

The report follows a four-layer reading path: headline status, historical trajectory, channel composition, and campaign-level accountability. Each layer answers a different question a stakeholder brings to the account, moving from *how are we doing* to *where exactly is the return coming from*.

1 Executive KPI Layer

The scorecards intentionally surface only four metrics that determine overall fleet health: Revenue, Conversions, Clicks, and Conversion Rate. Limiting the KPI layer to the most decision-critical indicators lets an executive judge account health in seconds, before drilling into the diagnostic visuals below.

2 Performance Trend

A dual Y-axis view plots Total Revenue (\$0–\$1M) against Traffic Clicks (0–60K) from January 2018 through July 2024. Reading the two series together lets an executive separate scalable growth, where traffic gains are matched by proportional revenue, from inefficient growth, where traffic rises faster than revenue, which in turn informs how future budget and bid strategy should be set.

3 Device Intelligence

A donut chart breaks total revenue into Mobile (64%), Desktop/Computers (29.9%), and Tablet (6.1%). The segmentation exists to guide channel-specific investment: it ensures mobile experience work receives budget in proportion to the revenue it actually generates, rather than by assumption.

4 Campaign Matrix

A color-density heatmap spans Spend, Clicks, Conversions, and Revenue across every active Search and PMax structure. Rather than requiring an operator to manually sort a flat table, the color gradient functions as an operational decision layer: it isolates top- and bottom-decile campaigns in a single glance, so budget can move toward what is working without waiting on an analyst.

4 Core Performance Insights & Data Analysis

4.1 Macro Revenue Trajectory

The trend chart shows a fleet running at low, largely flat volume from January 2018 through Q3 2020, followed by sustained expansion beginning in Q4 2020. From that point forward, revenue and clicks climb together, reaching peak monthly runs above **\$900K** in late 2023. Because the two series move together, the growth reflects genuine demand and traffic scaling rather than a short-term promotional spike or an isolated shift in conversion rate.

STRATEGIC READ

Treat the post-2020 trajectory as the new operating baseline, not an anomaly. Budget and bid-strategy targets should be benchmarked against the late-2023 peak run-rate rather than the multi-year average, which is pulled down by the flat 2018–2020 period.

BUSINESS IMPACT

Because growth has been sustained rather than promotional, future media investment can be modeled against recent operating performance instead of long-run historical averages, reducing the risk of underforecasting during annual budget planning.

4.2 Device-Level Revenue Composition

The device chart confirms a mobile-first revenue profile: mobile devices generate **64%** of total revenue, ahead of Desktop/Computers at **29.9%** and Tablet at **6.1%**. This split reflects genuine audience behavior and carries direct implications for creative sizing, landing page responsiveness, and device-level bid modifiers.

STRATEGIC READ

With nearly two-thirds of return concentrated on mobile, conversion-rate optimization and page-speed work should be sequenced mobile-first. Desktop remains a meaningful secondary surface at roughly 30% of revenue and should not be deprioritized; Tablet's sub-7% share makes it a candidate for reduced bid priority rather than active investment.

BUSINESS IMPACT

This also justifies shifting creative production resources toward mobile-first asset design and running landing page experiments on mobile templates before desktop variants, so testing effort follows the revenue rather than trailing it.

4.3 Campaign Structure Efficiency: Performance Max Dominance

The campaign matrix confirms Performance Max as the dominant driver of fleet return, with the top individual PMax campaigns each generating between **\$1.8M and \$2.0M** in conversion value. This concentration indicates the account has reached a data maturity threshold at which Google's automated bidding and creative delivery materially outperform narrower, manually structured Search campaigns.

PERFORMANCE SIGNAL	OBSERVATION	STRATEGIC IMPLICATION
Top PMax campaign value	\$1.8M–\$2.0M per campaign	Prioritize incremental budget toward proven top-decile PMax structures

Heatmap concentration	High-density cells cluster around PMax and Hybrid structures	Validates PMax as the primary scaling lever going forward
Search campaign role	Secondary contributor relative to PMax	Retain for brand and high-intent query control, not primary growth

STRATEGIC READ

Continued growth is more efficiently achieved by deepening budget and asset-group coverage within proven PMax structures than by fragmenting spend across additional narrow Search campaigns. Search should be retained for brand defense and high-intent query capture, but PMax is the primary scaling lever.

BUSINESS IMPACT

Because performance is now automation-led, future experimentation should focus on improving the inputs automation depends on: first-party audience signals, creative asset depth, and offline conversion imports, rather than adding further campaign fragmentation.

5 Forecast Outlook & Risk Monitoring

A dashboard built only to explain the past is incomplete for executive use. The following outlook and watch items extend the reporting suite from a historical record into a forward-looking planning input.

FORECAST OUTLOOK

Assuming revenue continues to grow at its current trajectory, maintaining today's efficiency would justify incremental quarterly media investment concentrated in the top-performing PMax structures, with marginal ROAS monitored closely as spend increases.

Risk & Watch Items

The following signals should be tracked alongside the core scorecard so that emerging risk is caught before it materially affects revenue.

RISK	MONITORING METRIC
Mobile CPC inflation	Mobile CPA
PMax overconcentration	Revenue share by campaign
Impression share loss	Lost impression share (budget)
Creative fatigue	CTR trend

Budget saturation

Marginal ROAS

6 Executive Recommendations & Strategic Scaling Roadmap

The findings above translate into three business objectives, each with two supporting actions. Executives allocate against objectives, not individual tasks, so the roadmap is grouped accordingly.

Revenue Acceleration

Reallocate budget toward top-decile PMax structures

Shift incremental spend from lighter, underperforming heatmap cells into the proven PMax campaigns generating \$1.8M–\$2.0M each, using the matrix as the ongoing allocation reference.

Deepen PMax asset groups and signal inputs

Expand first-party audience signal quality and creative asset diversity feeding the top campaigns to sustain the post-2020 growth curve rather than plateau at the 2023 peak.

Conversion Efficiency & Mobile Experience

Run a mobile-first conversion optimization audit

Prioritize page-speed, mobile checkout flow, and mobile creative review as the highest-leverage optimization available, given mobile's 64% revenue share.

Rebalance Desktop and Tablet bid strategy

Maintain Desktop investment at its roughly 30% revenue contribution while reducing Tablet-specific bid priority, freeing budget for mobile and top-PMax reallocation.

Reporting Governance & Forecasting

Institutionalize the Executive Center as the standing governance layer

Replace manual, export-based reporting cadences with the live dashboard as the single source of truth for fleet-level budget review.

Extend the matrix with efficiency-normalized metrics

Layer ROAS and cost-per-conversion into the existing heatmap columns to sharpen top-decile identification as the fleet scales, supporting the forecast and risk-monitoring cadence introduced in Section 5.
