

ROAS and budget pacing monitor

A financial control view for spend, return, pacing, and reallocation

PORTFOLIO DEMONSTRATION - ILLUSTRATIVE DATA

QUESTION

How can finance and marketing inspect return and pacing without losing campaign-level context?

DECISION

Define ROAS once, show portfolio and campaign views together, and isolate loss-making scenarios.

EVIDENCE RETAINED

Calculated-field logic, dashboard architecture, profitability diagnosis, and proposed actions.

VALIDATION

Reconcile revenue and cost, confirm attribution windows, flag low volume, and require approval before shifts.

CALCULATED FIELD DEFINITION

$$\text{Actual ROAS (\%)} = (\text{SUM(Conversion Value)} / \text{SUM(Cost)}) \times 100$$

Computed at the campaign grain, then aggregated to portfolio level so the same field powers both the scorecard and the campaign heatmap without a second calculation.

Expressed this way, a result of **1,244.30%** is equivalent to a **12.44x** multiple: for every \$1.00 of spend, \$12.44 of revenue was generated. The percentage format was chosen deliberately over a raw multiplier, since it aligns with how finance teams typically evaluate return-on-investment internally; the dashboard also carries the multiple as a secondary readout on hover for marketing-side stakeholders more accustomed to an "x" figure.

Because the field is computed at the campaign grain before aggregation, the same formula that produces the single portfolio-level scorecard figure also powers the campaign-level heatmap in Section 3, ensuring the headline ROAS and the campaign-level detail are always mathematically consistent with each other rather than sourced from separate calculations.

1 Fiscal KPI Layer

2 Spend vs. ROAS Trend

3 ROAS Pacing Matrix

The report follows a three-layer reading path: fiscal status, profitability trajectory, and campaign-level pacing. Each layer answers a different question a budget stakeholder brings to the account, moving from *are we profitable* to *where exactly should the next dollar go*.

STRATEGIC READ

Sub-1.0x campaigns are not underperforming; they are actively unprofitable at current spend levels. These are candidates for an immediate budget freeze, not a gradual optimization cycle.

BUSINESS IMPACT

Freezing spend on the identified sub-1.0x campaigns and reallocating that budget toward the top PMax structures is the single highest-leverage, lowest-risk action available this cycle, since it requires no new testing, only reallocation of spend already proven inefficient.

FORWARD OUTLOOK

Spend and ROAS are moving in partially opposite directions in the most recent months of the reporting window, with cost trending upward while ROAS moderates from its Q3 peak. Maintaining current PMax allocation while freezing the identified underperformers should stabilize blended ROAS above 10x even as the account continues to scale, assuming no material shift in auction competition.

Risk & Watch Items

The following signals should be tracked alongside the core scorecard so pacing risk is caught before it materially affects blended ROAS.

RISK	MONITORING METRIC
PMax revenue concentration	Revenue share, top 3 campaigns
Search cannibalizing brand terms	Brand vs. non-brand Search ROAS
Blended ROAS dilution from new tests	Portfolio ROAS, 30-day rolling trend
Underperformer budget creep	Sub-1.0x campaign spend share
Seasonal auction pressure (Q4)	CPC trend, November–December

5 Executive Budget Reallocation Recommendations & Strategic Roadmap

The findings above translate into three financial objectives, each with two supporting actions. Budget decisions should be allocated against these objectives, not individual campaign tickets.

Budget Reallocation & Scaling

Shift budget from sub-1.0x Search campaigns into top PMax structures

Freeze or reduce the two campaigns pulling 0.91x–0.92x ROAS and route the freed budget into the 54.62x PMax campaign and its closest peers, using the pacing matrix as the live allocation reference.

Set a PMax-first marginal budget rule

Default incremental monthly budget to PMax until campaign-level ROAS trend shows diminishing returns, rather than distributing new spend evenly across the account.

Underperformer Cutbacks & Efficiency

Formalize a sub-1.0x freeze threshold

Any campaign sustaining ROAS below 1.0x for two consecutive months triggers an automatic budget freeze pending review, replacing case-by-case discretionary judgment.

Audit standard Search structures for cannibalization

Confirm underperforming Search campaigns are not simply capturing brand-adjacent traffic that PMax would otherwise convert at materially higher efficiency.

Reporting Governance & Forecasting

Institutionalize the Monitor as the standing budget pacing review

Replace manual spend exports with the live dashboard as the shared source of truth for finance and marketing budget conversations.

Add pacing alerts to the calculated ROAS field

Extend the custom metric with month-over-month delta thresholds so campaigns crossing into unprofitable territory are flagged automatically, rather than discovered during manual review.

EXECUTIVE TAKEAWAY

The ROAS and Budget Pacing Monitor converts spend and revenue into a single fiscal ratio the business can act on in real time, turning budget reallocation from a quarterly exercise into a continuous, evidence-based process.
